Topics

Little Bobby loves chocolate, and he frequently goes to his favorite **5&10** store, Penny Auntie, with n dollars to buy chocolates. Each chocolate has a flat cost of c dollars, and the store has a promotion where they allow you to trade in m chocolate wrappers in exchange for **1** free piece of chocolate.

For example, if $m = 2$ and Bobby has $n = 4$ dollars that he uses to buy **4** chocolates at $c = 1$ dollar apiece, he can trade in the **4** wrappers to buy **2** more chocolates. Now he has **2** more wrappers that he can trade in for **1** more chocolate. Because he only has **1** wrapper left at this point and $1 < m$, he was only able to eat a total of **7** pieces of chocolate.

Given n , c , and m for t trips to the store, can you determine how many chocolates Bobby eats during each trip?

Input Format

The first line contains an integer, t , denoting the number of trips Bobby makes to the store.

Each line i of the t subsequent lines contains three space-separated integers describing the respective n , c , and m values for one of Bobby's trips to the store.

Constraints

- $1 \leq t \leq 1000$
- $2 \leq n \leq 10^5$
- $1 \leq c \leq n$
- $2 \leq m \leq n$

Output Format

For each trip to Penny Auntie, print the total number of chocolates Bobby eats on a new line.

Sample Input

```
3
10 2 5
12 4 4
6 2 2
```

Sample Output

```
6
3
5
```

Explanation

Bobby makes the following **3** trips to the store:

- He spends his **10** dollars on **5** chocolates at **2** dollars apiece. He then eats them and exchanges all **5** wrappers to get **1** more chocolate. We print the total number of chocolates he ate, which is **6**.
- He spends his **12** dollars on **3** chocolates at **4** dollars apiece; however, he needs **4** wrappers to trade for his next chocolate. Because he only has **3** wrappers, he cannot purchase or trade for any more chocolates. We print the total number of chocolates he ate, which is **3**.
- He spends **6** dollars on **3** chocolates at **2** dollars apiece. He then exchanges **2** of the **3** wrappers for **1** additional piece of chocolate. Next, he uses his third leftover chocolate wrapper from his initial purchase with the wrapper from his trade-in to do a second trade-in for **1** more piece of chocolate. At this point he has **1** wrapper left, which is not enough to perform another trade-in. We print the total number of chocolates he ate, which is **5**.
