Alice is learning English and wants to keep track of all of the new words she learns. Being a programmer, Alice decides to put all of her words into one string,  $s$ , where each word is separated by a single underscore character. This is known as [Snake Case](#). Can you determine the number of words in Alice's string?

Given  $s$ , print the total number of underscore-delimited words it contains on a new line.

**Note:** You simply need to count the number of words; do not concern yourself with whether or not the words are distinct.

## Input Format

A single line containing string  $s$ .

## Constraints

- $1 \leq |s| \leq 100$
- Each word in  $s$  consists of one or more lowercase English alphabetic letters.
- All words in  $s$  are delimited by single underscores (`_`).

## Output Format

Print the number of underscore-delimited words in string  $s$ .

## Sample Input 0

```
have_a_nice_day
```

## Sample Output 0

```
4
```

## Explanation 0

h	a	v	e	_	a	_	n	i	c	e	_	d	a	y
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

String  $s$  contains four words:

1. have
2. a
3. nice
4. day

Thus, we print **4** on a new line.
